

PERFORMANCE EVALUATION

BlazeMeter was used to measure the performance of the the web application under varying numbers of concurrent users. Only the the GET function was tested due to the limitations of BlazeMeter. Apache JMeter would be able to perform this but we could not get it to work in the lab computers.

10 Concurrent Users

20 Concurrent Users

As we can see, the response time of the web application when 10 concurrent users are using it does not vary greatly from when it is handling 20 concurrent users. This shows that the web application is still running efficiently even with 20 concurrent users. Unfortunately, BlazeMeter does not allow testing for more than 20 concurrent users so it was not fully tested.
